

# COEN 241 HW1

Shivani Gopal Deosatwar

W1621005

## 1. QEMU

### Installation

#### 1) Download ISO

For assignments, Ubuntu guest VM is needed which requires server ISO image.

I have used following link:

ARM (Apple Silicon): [Ubuntu 20.04 Server for ARM](#)

#### 2) As I am using MacBook Air M1 chip, following commands worked for installing QEMU on my laptop.

```
brew install qemu
```

#### 3) To create QEMU image, following command is used:

```
qemu-img create ubuntu.img 20G -f qcow2
```

#### 4) VM installation:

```
qemu-system-aarch64 \
-accel hvf -cpu cortex-a57 -M virt,highmem=off -m 2G \
-smp 2 \
-drive
file=/opt/homebrew/Cellar/qemu/6.2.0_1/share/qemu/edk2-aarc
h64-
code.fd,if=pflash,format=raw,readonly=on \
-drive if=none,file=ubuntu.img,format=qcow2,id=hd0 \
-device virtio-blk-device,drive=hd0,serial="trial_2" \
-device virtio-net-device,netdev=net0 \
-netdev user,id=net0 \
-vga none -device ramfb \
-cdrom ubuntu-20.04.4-live-server-arm64.iso \
```

```
-device usb-ehci -device usb-kbd -device usb-mouse -usb  
-nographic
```

Instructions will be displayed on the screen and which needs to be followed to install the VM successfully.

5) Run image:

```
qemu-system-aarch64 \  
-accel hvf -cpu cortex-a57 -M virt,highmem=off -m 2G \  
-smp 2 \  
-drive  
file=/opt/homebrew/Cellar/qemu/6.2.0_1/share/qemu/edk2-aarc  
h64-  
code.fd,if=pflash,format=raw,readonly=on \  
-drive if=none,file=ubuntu.img,format=qcow2,id=hd0 \  
-device virtio-blk-device,drive=hd0,serial="trial_2" \  
-device virtio-net-device,netdev=net0 \  
-netdev user,id=net0 \  
-vga none -device ramfb \  
-device usb-ehci -device usb-kbd -device usb-mouse -usb  
-nographic
```

## 2. Experimental setup

System configurations are:

MacBook Air (M1, 2020)

M1 chip

8 GB memory

I am considering following 3 test cases for experimenting:

- 1) 2cores with 2GB memory allocation
- 2) 4cores with 4GB memory allocation
- 3) 6 cores with 6GB memory allocation

Same has been used for Docker as well.

### 3. Docker

Docker is used to create and manage containers to run and maintain different images.

#### Installation

- 1) Rosetta 2 is required to be installed for docker.  
softwareupdate-install-rosetta
- 2) Install docker engine  
Copy image from [here](#).
- 3) Check if installed successfully.
- 4) Docker run hello-world

#### Output

```
preetibhosale@Preetis-MacBook-Air ~ % docker run hello-world
zsh: command not found: docker
[preetibhosale@Preetis-MacBook-Air ~ % docker run hello-world
Unable to find image 'hello-world:latest' locally
[latest: Pulling from library/hello-world
7050e35b49f5: Pull complete
Digest: sha256:18a657d0cc1c7d0678a3fbea8b7eb4918bba25968d3e1b0adefaf71caddbc346
Status: Downloaded newer image for hello-world:latest

Hello from Docker!
This message shows that your installation appears to be working correctly.

To generate this message, Docker took the following steps:
1. The Docker client contacted the Docker daemon.
2. The Docker daemon pulled the "hello-world" image from the Docker Hub.
   (arm64v8)
3. The Docker daemon created a new container from that image which runs the
   executable that produces the output you are currently reading.
4. The Docker daemon streamed that output to the Docker client, which sent it
   to your terminal.

To try something more ambitious, you can run an Ubuntu container with:
$ docker run -it ubuntu bash

Share images, automate workflows, and more with a free Docker ID:
https://hub.docker.com/

For more examples and ideas, visit:
https://docs.docker.com/get-started/
```

### 4. Experiments- Reports and findings

## Configuration 1: 2GB RAM and 2 cores

Tests:

- 1) Max-prime=2000, time=30 seconds
- 2) Max-prime=20000, time=30 seconds
- 3) Max-prime=200000, time=30 seconds

Sysbench command:

```
sysbench cpu --cpu-max-prime={some_value} --num-threads={some_value}
--time= {some_value} run
```

QEMU results:

Test 1:

```

#### 4. Conclusion

There is very slight deviation in the performance even after using more resources for both QEMU and Docker. Also when we increase max-prime value, events/sec decreases.

## 5. File I/O testing QEMU vs Docker

For File I/O testing, 2 mods are supported by sysbench:

- i. Sequential Rewrite (seqrewr)
- ii. Combined random read/write (rndrw)

file size=3GB

Performance is tested using experimental setups.

I will use two modes which sysbench supports, which are: We will keep the file size constant at 3GB and will test the performance against our experimental setups accordingly.

QEMU execution:

### 1) Sequential Rewrite

```
shivani@shivani:~$ sysbench --num-threads=16 --test=fileio --file-total-size=3G --time=30 --file-test-mode=seqrewr run
WARNING: the --test option is deprecated. You can pass a script name or path on the command line without any options.
WARNING: --num-threads is deprecated, use --threads instead
sysbench 1.0.18 (using system LuAJIT 2.1.0-beta3)

Running the test with following options:
Number of threads: 16
Initializing random number generator from current time

Extra file open flags: (none)
128 files, 24MiB each
3GiB total file size
Block size 16KiB
Periodic FSYNC enabled, calling fsync() each 100 requests.
Calling fsync() at the end of test, Enabled.
Using synchronous I/O mode
Doing sequential rewrite test
Initializing worker threads...

Conclusion:

Sequential rewrite operations is faster on QEMU than Docker. While for combined read write, docker is faster than QEMU.

## CONFIGURATION 2: 4GB RAM 4 CORES

Now, we change our system configuration and run the same tests again, to verify whether we

see any performance changes. Our next configuration is 4GB ram and 4 CPU cores for both

our QEMU VM and Docker.

Docker

- 1) Sequential Rewrite

```

/ # sysbench --num-threads=16 --test=fileio --file-total-size=3G --time=30 --fill-test-mode=seqwr run
WARNING: the --test option is deprecated. You can pass a script name or path on the command line without any options.
WARNING: --num-threads is deprecated, use --threads instead
sysbench 3.0.28-f6f76117dc4 (using bundled LuaJIT 2.1.0-beta2)

Running the test with following options:
Number of threads: 16
Initializing random number generator from current time

Extra file open flags: (none)
128 files, 24MiB each
3GiB total file size
Block size 16KiB
Periodic FSYNC enabled, calling fsync() each 100 requests.
Calling sync() at the end of test, Enabled.
Using synchronous I/O mode
Doing sequential rewrite test
Initializing worker threads...

Threads started!

File operations:
  reads/s:          0.00
  writes/s:        13778.77
  fsyncs/s:       17701.47

Throughput:

Conclusion:

Performance of file io decreases if resources are increased. Sometimes QEMU is better than Docker.

Performance Analysis:

a) QEMU

Disk

1) 2GB 2cores
